in assessing the astronaut s exposure from galactic cosmic rays on space missions of long duration conversion of absorbed doses to dose equivalents is required since a large part of the dose contribution from heavy primaries is produced at linear energy transfer let values beyond the range for which radiobiological data are available it seems preferable to analyze the let distributions themselves and to compare them to standard x rays rather than to assume arbitrary values for the relative biological effectiveness rbe the local let distributions in tissue are found to be extremely skewed with a large maximum at the relativistic minimum let lined up on the let scale they cover the very wide interval from 0.18 to 2790 kev micron t as compared to an interval from 0.4 to 35 kev micron t for standard x rays applying the rbe formula of the rbe committee of the icrp and a saturation value of 10 leads to a grand mean rbe of 1.82 for the total absorbed dose of 13 millirads 24 hours from primaries author
