evaluates the natural history of congenital heart lesions as a background to finding out if
and how much treatment has improved outcomes introduces and defines lesions providing
general information about its frequency familial or syndromic associations and associated

congenital heart lesions provides sections on pathological anatomy and physiology important in determining outcomes includes results of surgery both in terms of survival and also in terms of event free survival that is survival free of reoperation cardiac failure arrhythmias and other late complications that are often seen helps cardiologists and cardiac surgeons understand what is likely to happen to patients with or without treatment and which forms of treatment currently in use provide the best outcomes to date

as well as by the list of open problems in the final section of this monograph the computational power of rational homotopy theory is due to the discovery by quillen 135 and by sullivan 144 of an explicit algebraic formulation in each case the rational homotopy type of a topological space is the same as the isomorphism class of its algebraic model and the rational homotopy type of a continuous map is the same as the algebraic homotopy class of the corresponding morphism between models these models make the rational homology and homotopy of a space transparent they also in principle always and in practice sometimes enable the calculation of other homotopy invariants such as the cup product in cohomology the whitehead product in homotopy and rational luster nik schnirelmann category in its initial phase research in rational homotopy theory focused on the identification of these models these included definition of rational homotopy invariants in terms of the homotopy lie algebra the translation of the whitehead product to the homotopy groups of the loop space ΩX under the isomorphism $H_1(\Omega X, \mathbb{Q}) \cong H_2(X, \mathbb{Q})$ category and cone length since then however work has concentrated on the properties of these invariants and has uncovered some truly remarkable and previously unsuspected phenomena for example if X is an n dimensional simply connected finite cw complex then either its rational homotopy groups vanish in degrees $2 \leq 2n$ or else they grow exponentially
