intermetallic science is closely related to physics chemistry metallurgy materials science technology and engineering  
this book emphasizes the chemical aspects of this science and therefore the mutual reactivity of metals and the  
characteristics of intermetallic compounds topics included are phase diagrams of alloy systems many intermetallic  
systems form several compounds generally not obeying common simple stoichiometric rules which are often  
homogeneous in a certain range of compositions the stability and extension of these phases are conveniently  
presented through phase diagrams selected aspects of intermetallics structural chemistry with emphasis on the  
solid state the general structural characteristics of intermetallic phases are considered with attention to

nomenclature and to alternative and complementary methods of presenting crystal chemical data a brief account is given of derivative and degenerate structures modular aspects of crystal structures and of a few special groups of alloys such as quasicrystals and amorphous alloys a number of selected structural prototypes with typical features their possible grouping in structural families and their distribution among different types of alloys are provided intermetallic reactivity trends in the periodic table attention is given to a few selected elemental parameters such as electron configuration and valence electron number and to their changes along the table which act as reference factors of the intermetallic behaviour as an example the relationships are considered between crystal structure and the number of valence electrons per atom or per formula in various classes of compounds or solid solution phases alloying behaviour systematics of intermetallic systems with a description of the intermetallic reactivity of each element or group of elements in the order of their position in the periodic table for each pair of metallic elements their capability to form intermediate phases is summarised by maps and schemes a description of small scale preparation methods of intermetallics a number of interesting and significant peculiarities are e g those related to their high melting points insolubility in common solvents etc systematic treatment of alloying behaviour wide overview of intermetallic chemistry illustrated with many examples
