this book is a collection of the papers presented at the 32nd communicating process architecture conference cpa held at the technical university eindhoven the netherlands from the 1st to the 4th of november 2009 concurrency is a fundamental mechanism of the universe existing in all structures and at all levels of granularity to be useful in this universe any computer system has to model and reflect an appropriate level of abstraction for simplicity therefore the system needs to be concurrent so that this modeling is obvious and correct today the commercial reality of multicore processors means that concurrency issues can no longer be ducked if applications are going to be able to exploit more than an ever diminishing fraction of their power this is a second but very forceful reason to take this subject seriously we need theory and programming technology that turns this around and makes concurrency an elementary part of the everyday toolkit of every software engineer this is what these proceedings are all about subjects covered in this volume include system design and implementation for both hardware and software tools for concurrent programming languages libraries and run time kernels and formal methods and applications

process from that beginning we have progressed to the point where the eda community at large including both users and developers of the tools are interested in more unified environments here the notion is that the tools used at the various stages in the development process need to be able to complement each other and to communicate with one another efficiently using effective file exchange capabilities furthermore the idea of capturing all the tool support needed for an eda development into a unified support environment is now becoming a reality this reality is evidenced by some of the eda suites we now see emerging wherein several tool functions are integrated under a common graphical user interface gui with supporting file exchange and libraries to enable all tool functions to operate effectively and synergistically this concept which we illustrate in figure 1 2 is the true future of eda

the contributions of a diverse selection of international hardware and software specialists are assimilated in this book s exploration of the development of massively parallel processing mpp the emphasis is placed on industrial applications and collaboration with users and suppliers from within the industrial community consolidates the scope of the publication from a practical point of view massively parallel data processing is a vital step to further innovation in all areas where large amounts of data must be processed in parallel or in a distributed manner e g fluid dynamics meteorology seismics molecular engineering image processing parallel data base processing mpp technology can make the speed of computation higher and substantially reduce the computational costs however to achieve these features the mpp software has to be developed further to create user friendly programming systems and to become transparent for present day computer software application of novel electro optic components and devices is continuing and will be a key for much more general and powerful architectures vanishing of communication hardware limitations will result in the elimination of programming bottlenecks in parallel data processing standardization of the functional characteristics of a programming model of massively parallel computers will become established then efficient programming environments can be developed the result will be a widespread use of massively parallel processing systems in many areas of application
