this book metric space has been written for the students of various universities in the earlier chapters proof are given in considerable detail as our subject unfolds through the successive chapters and the reader acquires experience in following abstract mathematical arguments the proof become briefer and minor details are more and more left for the reader to fill in for himself it is a basic principle in the study of mathematics and one too seldom emphasised that a proof is not really understood until the stage is reached at which one can grasp it is a whole and see it as a single idea in achieving this end much more is necessary than merely following the individual steps in the reasoning contents basic concept of set metric space compactness

text on the theory of functions of one complex variable contains with many elaborations the subject of the courses and seminars offered by the author over a period of 40 years and should be considered a source from which a variety of courses can be drawn in addition to the basic topics in the cl

one of the first books to be dedicated specifically to metric spaces full of worked examples to get complex ideas across more easily

this book presents modern algebra from first principles and is accessible to undergraduates or graduates it combines standard materials and necessary algebraic manipulations with general concepts that clarify meaning and importance this conceptual approach to algebra starts with a description of algebraic structures by means of axioms chosen to suit the examples for instance axioms for groups rings fields lattices and vector spaces this axiomatic approach emphasized by hilbert and developed in germany by noether artin van der

waerden et al in the 1920s was popularized for the graduate level in the 1940s and 1950s to some degree by the authors publication of a survey of modern algebra the present book presents the developments from that time to the first printing of this book this third edition includes corrections made by the authors

an introduction to metric spaces for those interested in the applications as well as theory

the purpose of this book is to communicate some of the recent advances in this field while preparing the reader for more advanced study the material can be roughly divided into three different types classical standard but sometimes with a new twist and recent the author first studies basic covering theorems and their applications to analysis in metric measure spaces this is followed by a discussion on sobolev spaces emphasizing principles that are valid in larger contexts the last few sections of the book present a basic theory of quasisymmetric maps between metric spaces much of the material is recent and appears for the first time in book format

evolutionary biology has grown from the highly controversial world view of the days of charles darwin to a complex and refined theory of nature s expression through the deep and subtle action of the genetic code the geometry of genetics is an interdisciplinary monograph that presents the mathematical basis of molecular genetics endowing evolutionary biology with a precision not before available to the subject to make this work accessible to biologists and physical scientists alike the authors have divided the subject into three parts structure statics and dynamics each of these parts is further subdivided into a presentation of the relevant mathematics a description of the biological problem and a mathematical reformulation of the biological problem they provide in effect basic mathematical and biological primers for each topic covered in the first part of the book statics the authors develop some set theoretic and linear algebraic notions and describe the origin and evolution of the genetic code here they reveal the beauty of the hidden symmetries of the standard genetic code and of their extension of genetic coding theory the generalized genetic code the second part of the book structure expresses the basic processes of molecular genetics replication transcription and translation as operators on a certain linear space the final part dynamics realizes the action of molecular genetics as a differential geometry within which evolutionary motions are treated as geodesics it is here that evolutionary biology can be seen unfolding on the rich mathematical construct of a space time manifold this natural progression from statics to structure and dynamics provides a nested cohesiveness which reveals the intricate natural hierarchy of the elementary genetic code molecular genetic action and macromolecular evolution which gives rise to a variety of genetic cosmologies the geometry of genetics expresses the fundamental actions of evolutionary biology with a new richness and precision that should prove illuminating to biologists and physical scientists alike

this fully updated new edition of wilson sutherland s classic text introduction to metric and topological spaces establishes the language of metric and topological spaces with continuity as the motivating concept before developing its discussion to cover compactness connectedness and completeness

this introductory book contains a rich collection of exercises and worked examples in metric spaces other than questions in the traditional setting plenty of true or false type questions and open ended questions are included with detailed solutions these are highly effective in helping students gain a bird s eye view and master the subject and pitfalls better the presentation is clear in nurturing the mathematical insights and mathematical maturity of the readers in this book the pictorialization or visualization of abstract situations into simple pictures is very often crucially conducive to the understanding of the materials this serves to

give an insightful view of the intricate problems as well as a clue or a direction to formulate rigorous arguments the learning outcomes include
