target discovery is a field that has existed for several years but is so vibrant today because of the recent progress in our understanding of the molecular mechanisms of many human diseases and the technical advances in target identification and validation more sophisticated gene profiling technologies such as dna microarrays and serial analysis of gene expression permit rapid identification of lead targets moreover analysis of gene networks in living organisms allows the identification of target genes that operate in defined physiological pathways with the sequencing of several genomes completed and the rapidly growing gene expression databases there is now greater impetus than ever before for in silico discovery of therapeutic targets also recent advances in genetic technologies have increased our ability to generate mouse models for human diseases the implications of these genetically modified animals in drug development are several including identification of new drug targets predicting efficacy and uncovering possible side effects together these recent technical advances should allow researchers to make the most informed choice early and advance the chosen targets toward clinical studies regarding cancers any difference between a cancer and a normal cell could potentially be exploited as a therapeutic target the hope is that drugs targeting specific constituents or pathways in cancer cells will provide more effective therapy either alone or in combination with other currently used anticancer drugs in addition to drug targets identifying new target antigens remains as much of a challenge as improving tumor vaccines already in the clinic

it is an exciting time to follow the new developments in the field of biotechnology and its wider applications in the different areas the whole genomes of over 1000 viruses and over 100 microbes can now be found in entrez genome the genomes represent both completely sequenced organisms and those for which sequencing is still in progress the three main domains of life bacteria archaea and eukaryota are represented as well as many viruses and organelles the exponential increase of the

sequence data lead to the development of the new bioinformatics field in order to attempt making sense at least biological sense out of all the new and fast data it will take also other techniques such as functional genomics to link the gap between a specific phenotype or a treatment and a gene sequence functional genomics tools are therefore important for the accurate molecular diagnosis prognosis target discovery validation needed for drug development and novel targets for antibiotics development functional genomics are also important for the confirmation of therapy in pharmacogenomics studies biotechnology is in many respects shaping our life and affecting our means of production and the creation of jobs progress in the applications of biotechnology depends on a wide base of basic as well as applied sciences the output of biotechnology has already proved itself in many diverse fields from health to biomining and from agriculture to enzyme breeding it is therefore difficult to follow all of the current as well as the potential applications of biotechnology the objective of the biotechnology annual review series is to attempt to provide readers with the needed indepth knowledge by reviewing specific topics in biotechnology in each issue the philosophy behind this series is to encourage good reviews to make it easier for readers to keep in touch with progress and applications of biotechnology reviews on topics related to regulatory affairs social impact of biotechnology biodiversity biosafety public acceptance and patent issues are also encouraged

this is a revised edition of an important title originally published in 2009 it is written primarily for psychotherapists and other practitioners and describes a new and effective form of dynamic therapy designed for working with adults and with adolescents the theory on which the new form of therapy is based is centred in a paradigm that extends and crucially alters the paradigm for developmental psychology opened by the bowlby ainsworth attachment theory it describes a pre programmed process the dynamics sustaining attachment and interest sharing which is activated as soon as people perceive that they are in danger this process is made up of seven pre programmed systems which interact with one another as an integrated whole they include bowlby s two complementary goal corrected behavioural systems attachment also referred to as careseeking and caregiving whenever the process is able to function effectively it enables people to adapt more constructively and co operatively to changing circumstances
