there is a new trend in the education of audiologists that emphasizes the basics of hearing hearing its physiology and pathophysiology addresses this trend it covers not only the basics of hearing but also the basics of pathophysiology which is not covered in a comprehensive way in any other text today this book recognizes the fact that the diseased auditory system does indeed function but in a different way than the normal system few books have addressed the pathophysiology of the ear and the auditory nervous system most books on hearing begin with a detailed description of the physics of sound which scares many readers away because they believe they need to understand acoustics to understand how the ear functions hearing its physiology and pathophysiology does not assume that the readers are physicists which would be analogous to assuming that visual physiologists would need to know quantum mechanics to understand how the visual nervous system functions this book provides

a thorough understanding of the anatomy and function of the auditory system to the basic scientist it will provide an understanding of the auditory system and how it works to the clinician it will provide insight into the normal and diseased auditory system

a series of judgment tests were conducted to investigate subjective judgments of single modulated and multiple tones plus noise the subjects were asked to judge which of two sounds tones plus noise or noise alone was noisier or in some cases louder stimuli included both broadband and octave band noises together with single tones at 250 500 1000 2000 4000 hz amplitude and frequency modulated tones of 500 and 2000 hz were also employed multiple tone stimuli included 2 and 5 tone complexes with overall frequency spacings of 1 10 1 3 1 4 3 and 2 octaves analysis of the judgment results were made using calculated perceived noise level and pure tone correction procedures suggested both by little and by kryter and pearsons in general the pure tone corrections were necessary the exception being situations in which the pure tone is added to an octave band of noise in one test series however the pure tone adjustment appears to overcorrect in all conditions the effect of the instruction set was marked the addition of a pure tone to noise had less effect on judgments of loudness and more effect on judgments of noisiness the average difference was 5 db modulated tones showed little difference from those of unmodulated tones except at low modulation rates which produced annoying beats for multiple tones there appeared to be no difference in people s assessment of harmonic and non harmonically related tone complexes although the noisiness increases somewhat with increase in number of tones this effect does not require modification of the present pure tone correction methods summary
