operations in this book is a focus on electronic warfare which is defined as a military action involving the use of electromagnetic and directed energy to control the electromagnetic spectrum or to attack the enemy. This book consists of public documents which have been located, gathered, combined, reformatted and enhanced with a subject index, selectively edited and bound to provide easy access.

The rapid evolution of radio and radar systems for military use during the second world war and devices to counter them led to a technological battle that neither the axis nor the allied powers could afford to lose. The result was a continual series of thrusts, parries and counter thrusts as first one side then the other sought to wrest the initiative in the struggle to control the ether. This was a battle fought with strange sounding weapons: Freya, Mandrel, Boozer and Window, and was characterised by the bravery, self sacrifice and skill of those who took part in it. However for many years the use of electronic warfare systems during the conflict remained a closely guarded military secret. When that veil of secrecy was finally lifted, the technicalities of the subject meant that it remained beyond the reach of lay researchers and readers. Alfred Price, an aircrew officer with the RAF where he flew with V Force and specialised in electronic warfare and air fighting tactics, was in the unique position to lift the lid on this largely unexplored aspect of the second world war. When it was first published in 1967, *Instruments of Darkness* came to be regarded as a standard reference work on this intriguing subject. This completely revised edition concludes with the Japanese surrender in August 1945 and brings the analysis fully up to date in the light of what we now know. This book is expertly done, an excellent treatise, *The Times Literary Supplement*.

The fifth book in the bestselling Artech House EW 100 series explores electronic warfare in space. Practical problems including intercept and jamming of hostile signals transmitted from the earth's surface and the vulnerability of satellite links to attack from the earth's surface are discussed. Spherical trigonometry is covered to provide the

background necessary to understand the scope of satellite problems orbit mechanics specifically the way the earth and its satellites revolve around one another is also explained the basics of radio propagation and how it applies to communications electronic warfare are demonstrated as well as the special considerations that apply to radio transmission to and from an earth satellite satellite links and link vulnerability are discussed readers learn how to calculate the distance over which a satellite can view as a function of its orbital parameters how long the satellite can see that point and the frequency shift in signals received by the satellite or an earth based receiver ew applications of orbit mechanics satellite links radio propagation and link vulnerability written by an expert in the field this book is useful for technical and non technical professionals
