the sine gordon model is a ubiquitous model of mathematical physics with a wide range of applications extending from coupled torsion pendula and josephson junction arrays to gravitational and high energy physics models the purpose of this book is to present a summary of recent developments in this field incorporating both introductory background material but also with a

strong view towards modern applications recent experiments developments regarding the existence stability dynamics and asymptotics of nonlinear waves that arise in the model this book is of particular interest to a wide range of researchers in this field but serves as an introductory text for young researchers and students interested in the topic the book consists of well selected thematic chapters on diverse mathematical and physical aspects of the equation carefully chosen and assigned

this study analyzes the methods used by international criminal tribunals when determining customary international criminal law and to consider the compatibility of these approaches with the nullum crimen sine lege principle in this context the following research questions are of particular importance is there one approach common to all international criminal tribunals or can different approaches be detected in their jurisprudence when determining customary international law do international criminal tribunals regard both traditional elements of customary international law state practice and opinio iuris as necessary elements for the establishment of customary international law do international criminal tribunals argue along the lines of the international court of justice icj requiring a high frequency and consistency of state practice that is both extensive and virtually uniform in addition the book analyzes the evidence used by international criminal tribunals in order to establish the constituent elements of customary international it then poses the question do international criminal tribunals distinguish as defined by schwarzenberger between the law creating processes of public international law on the one hand and the law determining agencies as a subsidiary means of determining rule of law on the other assuming that they exist how can different methodological approaches to determine customary international law be assessed in light of the nullum crimen sine lege principle does the principle require judges to apply the traditional method to establish customary international law as being based on extensive uniform and enduring state practice accompanied by opinio iuris can the principle balance the desire for justice and the specificities of law creation of the international legal order with fairness for the accused how can the law be accessible and criminal punishment foreseeable when the underlying legal basis for criminal convictions namely customary international criminal law is unwritten in nature

sine syndromes sss represent atypical forms of inflammatory rheumatic diseases the courses of which are often severe while the diagnosis of rheumatic diseases can be determined according to an established set of diagnostic criteria based on clinical characteristics and laboratory parameters sine syndromes do not fulfill the standard criteria used to assist in the classification of patients with rheumatological disorders this concise book gives an overview of atypical courses in common

inflammatory rheumatic diseases such as Wegener's granulomatosis, systemic sclerosis syndrome or systemic lupus erythematosus. Each chapter reviews similar cases reported in the literature and presents current data on treatment options drawing on their vast clinical experience. The editors provide a series of detailed case reports in order to illustrate the different types of disease. The book is intended to facilitate early diagnosis and effective therapy in patients where a schematic approach may not prove sufficient. Sine syndromes in rheumatology will serve as a useful and easily accessible reference for specialists in rheumatology as well as for practitioners in the fields of internal medicine, pediatrics and orthopedics.

This open access book serves as a compact source of information on sine cosine algorithm (SCA) and a foundation for developing and advancing SCA and its applications. SCA is an easy user friendly and strong candidate in the field of metaheuristics algorithms. Despite being a relatively new metaheuristic algorithm, it has achieved widespread acceptance among researchers due to its easy implementation and robust optimization capabilities. Its effectiveness and advantages have been demonstrated in various applications ranging from machine learning, engineering design and wireless sensor network to environmental modeling. The book provides a comprehensive account of the SCA including details of the underlying ideas, the modified versions, various applications and a working MATLAB code for the basic SCA.

This book covers various algorithmic developments in the perfect reconstruction cosine sine modulated filter banks (TDAC, MDCT, MDST or MLT, MCLT, low delay MDCT, complex exponential cosine sine modulated QMF filter banks) and near perfect reconstruction QMF banks, pseudo QMF banks in detail including their general mathematical properties, matrix representations, fast algorithms and various methods to integer approximations. Being recently a new transform technology for lossless audio coding, each chapter will contain a number of examples and will conclude with problems and exercises. The book reflects the research efforts, activities and achieved results of the authors in the time period over the last 20 years.
