the subject of kleinian groups and hyperbolic 3 manifolds is currently undergoing explosively fast development with many old problems and conjectures close to resolution this volume proceedings of the warwick workshop in september 2001 contains expositions of many of these breakthroughs including minsky s lectures on the first half of the proof of the ending lamination conjecture the bers density conjecture by brock and bromberg the tameness conjecture by kleineidam and souto the state of the art in cone manifolds by hodgson and kerckhoff and the counter example to thurston s k 2 conjecture by epstein marden and markovic it also contains jørgensen s famous paper on pairs of once punctured tori in print for the first time the excellent collection of papers here will appeal to graduate students who will find much here to inspire them and established researchers who will find this valuable as a snapshot of current research

this book brings together young researchers from a variety of fields within mathematics philosophy and logic it discusses questions that arise in their work as well as themes and reactions that appear to be similar in different contexts the book shows that a fairly intensive activity in the philosophy of mathematics is underway due on the one hand to the disillusionment with respect to traditional answers on the other to exciting new features of present day mathematics the book explains how the problem of applicability once again plays a central role in the development of mathematics it examines how new languages different from the logical ones mostly figural are recognized as valid and experimented with and how unifying concepts structure category set are in competition for those who look at this form of unification it further shows that traditional philosophies such as constructivism while still lively are no longer only philosophies but guidelines for research finally the book demonstrates that the search for and validation of new axioms is analyzed with a blend of mathematical historical philosophical psychological considerations

since the end of the 19th century a number of specialised journals albeit with a large audience

have regularly included articles on the history of chinese mathematics while a number of books on the history of mathematics include a chapter on the subject thus the progressive increase in our knowledge of the content of chinese mathematics has been accompanied by the realisation that as far as results are concerned there are numerous similarities between chinese mathematics and other ancient and medieval mathematics for example pythagoras theorem the double false position rules hero s formulae and ruffini harner s method are found almost everywhere as far as the reasoning used to obtain these results is concerned the fact that it is difficult to find rational justifications in the original texts has led to the reconstitution of proofs using appropriate tools of present day elementary algebra consequently the conclusion that chinese mathematics is of a fundamentally algebraic nature has been ventured however in recent decades new studies particularly in china and japan have adopted a different approach to the original texts in that they have considered the chinese modes of reasoning as these can be deduced from the rare texts which contain justifications by studying the results and the methods explicitly mentioned in these texts hand in hand this chinese and japanese research has attempted to reconstruct the conceptions of ancient authors within a given culture and period without necessarily involving the convenient but often distorting social and conceptual framework of present day mathematics
