across sub saharan africa countries with a greater percentage of overlapping days in their school and farming calendars also have lower primary school survival rates in theory greater overlap between the school and farming calendars should indeed reduce schooling investments and farm based child labor too as it constrains the time allocation opportunity set for both productive activities i causally identify such effects by leveraging a four month shift to the school calendar in malawi that exogenously changed the number of days that the school calendar overlapped with specific crop calendars which differentially affected communities

based on their pre policy crop allotments using panel data for school aged children i find that a 10 day increase in school calendar overlap during peak farming periods significantly decreases school advancement by 0.34 grades one lost grade for every three children and the share of children engaged in peak period household farming by 11 percentage points after four years secondary analyses reveal stronger negative schooling impacts for girls and poorer households driven by overlap with the labor intensive planting period a policy simulation illustrates that adapting the school calendar to minimize overlap with peak farming periods is a highly cost effective educational intervention to increase school participation by better accommodating farm labor demand
