salt affected soils characterized by high soluble salts saline or exchangeable sodium sodic impact plant growth and occur globally especially in arid and coastal regions salinization stems

from natural causes e.g. climate change sea level rise and human actions e.g. poor irrigation practices excessive water use. FAO's global map of salt affected soils reveals that over 1.381 billion hectares (10.7 percent of global land) are affected, with Australia, Argentina, and Kazakhstan among the most impacted countries. Increasing aridity and water demand amplify soil degradation risks, particularly in developing regions. Climate change and water scarcity threaten agricultural productivity, with substantial crop yield losses observed in saline areas. Halophytes and salt tolerant crops provide a foundation for saline agriculture, yet many salt affected soils remain unprotected and inadequately regulated. FAO's INSAS International Network of Salt Affected Soils underscores the need for updated data, harmonized salinity measurements, and sustainable management practices, with enhanced training and policy frameworks. Mitigation strategies like improved drainage, soil amendments, and the cultivation of salt tolerant plants are recommended. Key recommendations include scaling sustainable practices, investing in salt tolerant crop markets, improving data collection and water quality monitoring, conserving ecosystems, and fostering cross sector collaboration. Such integrated efforts aim to boost food production and resilience in affected regions while protecting vital ecosystems.
